

DO QUOC PHUONG

SOFTWARE DEVELOPER

PROFESSIONAL SUMMARY

Software Developer with 10+ years of experience in C#, web and desktop application development, system architecture, and database design. Experienced in transforming business requirements into scalable solutions, driving MVP delivery, CI/CD adoption, and workflow optimization. Strong believer that successful software comes from balancing technical quality, business value, and delivery speed through thoughtful engineering decisions.

WORK EXPERIENCE

Full Stack Developer | Open Dev

2024-Present

- Served as a Full Stack Developer, Team Lead, and DevOps Engineer, delivering digital products and providing technical consulting for clients.
- Designed and maintained AWS infrastructure, CI/CD pipelines (Jenkins, GitHub Actions, GitLab CI), and development workflows.
- Supported project estimation, effort breakdown, and proposal preparation for client engagements.
- Contributed to project estimation, effort breakdown, and quotation preparation for client proposals.
- Leveraged AI development tools (Cursor, Codex) to streamline requirements analysis, documentation, code generation, and team productivity.

Full Stack Developer | RikkeiSoft

2019-2024

- Served as a Full Stack Developer and Technical Team Leader, responsible for solution design, system architecture, core feature development, and team coordination.
- Led task planning, estimation, and development workflows; provided technical guidance, conducted code reviews, and ensured delivery quality.
- Occasionally took on Project Manager responsibilities for small projects, coordinating stakeholders, managing timelines, and tracking project progress.
- Translated business requirements into scalable, maintainable, and secure technical solutions while actively contributing to key system components.
- Developed a code generation tool for .NET 5 web applications, improving development speed by approximately 50% and reducing repetitive coding effort.
- Continuously enhanced technical and leadership capabilities through self-directed learning in software architecture, DevOps, project estimation, and team management.

Full Stack Developer | Huong Viet

2018-2019

- Served as a Full-Stack Developer and Technical Team Leader, with responsibilities spanning software development, solution design, and technical planning.
- Participated in technology research, architecture design, estimation, and technical decision-making for project delivery.
- Provided technical guidance, code reviews, and development support while contributing to core system components.
- Actively expanded expertise in software architecture, leadership, and project management.

Developer | Japan Comuter Software

2015-2018

- Worked as a Software Developer responsible for full-cycle development of internal business systems (CRM, HRM, Inventory Management, and other web applications), covering both frontend and backend.
 - Participated in requirement analysis, Basic Design, Detail Design, and database design/documentation.
 - Developed features, implemented APIs, and performed unit testing and integration testing.
 - Supported system deployment, maintenance, and production operations, including third-party service integration.
 - Assisted in on-site installation and setup of software and hardware systems at customer factories.
-

SKILLS

Programming Languages

C# (+7 years), Java (+2 years), NodeJS(+4 years), Python (+2 years), Javascript, ios swift (+1 years), PHP

Databases

MySql, SqlServer, PostgreSQL, Mongo, Redis

Frameworks / Platforms

.NET Core, .NET5+, xUnit, ASP.NET MVC, Entity Framework, Angular, VueJS, ReactJS, Spring Framework, WPF, WCF, Laravel, Django, NestJS, NextJS, NuxtJS, React Native, Apollo GraphQL, Express, ZodExpress, Jest

Soft Skills

Team leadership, task coordination, mentoring, problem solving, analytical thinking, communication, adaptability

Configuration Management tools

Git, SVN, Backlog, Zira, Trello, TFS

Programming Tools

Visual Studio, Eclipse, Visual Studio Code, Sublime Text

App server / Middleware

Microsoft IIS, Docker, AWS, Jenkins, XAMPP

AI Tools

Cursor, Codex, Copilot

Methodology

Scrum

Auto Test Tools

UI Path, Selenium, Playwright, xUnit

EDUCATION

Bachelor's Degree in Information Technology Pham Van Dong University

- Specialization: Computer Networks and Data Communications.
 - Degree Classification: Good.
 - Graduated: 03, 2015.
-

PROJECTS

Open Dev | 2024 - Present

Project: POS system

Description: A multi-platform POS (Point of Sale) system designed for restaurants, retail stores, and service businesses (e.g., nail salons). The system supports end-to-end operations including order management, payment processing, receipt printing, and device integration. The solution is composed of multiple dedicated terminals such as cashier stations, kitchen display systems (KDS), customer ordering kiosks, and service staff devices, enabling seamless workflow between front-of-house and back-of-house operations.

Team size: 10 people

Technology: .NET Standard, .NET Framework 4.6+, .NET 9+, WPF, WinUI3, AngularJS, ReactJS, AWS, Couchbase, xUnit

Responsibilities: Business analysis, system design, spec creation, coding, testing

Project: Survey system

Description: A web-based survey management system that allows users to create, manage, and distribute surveys across various domains. The system supports project-based survey organization and provides tools to streamline survey creation.

It integrates AI capabilities using OpenAI models to automatically generate survey questions and templates based on user input prompts, helping users quickly create structured and relevant surveys with minimal effort.

Team size: 8 people

Technology: ReactJS, NextJS, OpenAI, Supabase

Responsibilities: Spec creation, coding, testing

Project: CMS Management System

Description: A web-based website management platform that allows users to create, manage, and deploy HTML-based websites. The system provides reusable HTML templates and a component-based drag-and-drop interface, enabling users to build websites easily without requiring deep technical knowledge, similar to WordPress.

The platform is integrated with AWS to support automated deployment and infrastructure configuration, including domain setup, SSL certificate management, and hosting configuration. This enables users to publish their websites with a single click, simplifying the deployment process and improving usability.

Team size: 20 people

Technology: NodeJS, AWS Lambda, S3, Step Function, SNS, SES, ReactJS, RDS base MySQL

Responsibilities: Coding, testing, investigating system flow on AWS, troubleshooting issues, and improving system performance.

RikkeiSoft Corporation | 2019 - 2024

Project: Social Platform

Description: A KOL and content creator management platform built on a YouTube-based ecosystem, enabling users to manage, distribute, and monetize digital content including posts, videos, livestreams, and educational courses.

The system supports multiple monetization models such as subscription-based access, direct content purchase, and pay-per-view livestream donations. It also facilitates community building for creators, including idol fanbase management and event organization.

In addition, the platform provides administrative features for content moderation, user management, and system monitoring, including content tracking, approval workflows, and compliance control to ensure platform quality and safety.

Team size: 30 people

Technology: Java, ReactJS, AWS, Microservices, Firebase, Rocketchat, Elasticsearch, Multi payment gateways

Responsibilities: Coding, testing, improving system performance.

Project: Timesheet Management System

Description: A workforce scheduling and timesheet management system designed for factory employees, providing functionality similar to Google Calendar for intuitive user experience. The system allows workers to register and manage their working schedules, submit leave requests, and track assigned tasks on a personal calendar interface. It supports individual employee self-service features for time management and work registration. For administrators, the platform provides human resource management capabilities including workforce scheduling, task assignment, leave approval, and employee data management, helping optimize labor allocation and operational efficiency in factory environments.

Team size: 10 people

Technology: PHP, VueJS, MySQL

Responsibilities: Coding, testing

Project: Internship Management System

Description: A comprehensive trainee management system designed for organizations, training centers, and enterprises to manage foreign trainees and skilled workers throughout their lifecycle, from recruitment and onboarding to training, placement, and employment management.

The platform centralizes trainee profiles, including personal information, skills, qualifications, visa status, training records, work history, and compliance-related documents. It supports document management, schedule tracking, progress monitoring, and automated workflow processes to reduce administrative workload and improve operational efficiency.

The system also provides matching and placement features, enabling organizations to assign suitable trainees to partner companies based on skills, experience, language proficiency, and job requirements. Administrative users can monitor trainee status, contract periods, training progress, and regulatory compliance through centralized dashboards and reporting tools

Team size: 50 people

Technology: .NET5, VueJS, AWS, Redis, Tenant database

Responsibilities: Team leader, technical design, system design, coding, testing

Project: Beauty and Wellness Platform

Description: A smart fitness management platform designed for unmanned fitness boxes, enabling users to book training sessions, make online payments, and interact with fitness equipment through a mobile application.

The platform supports real-time monitoring of fitness rooms and connected IoT devices, allowing users to control and interact with in-room equipment during training sessions. Users can communicate with mentors through video calls, watch live-streamed training sessions, and request remote assistance via monitoring screens installed in fitness boxes.

The system includes security and operational features such as unauthorized access detection, session expiration reminders, and real-time facility monitoring.

The platform serves three types of users: fitness box operators (shops), online mentors, and trainees. Administrative features include remote monitoring, mentor and user management, shop management, and revenue tracking across multiple fitness locations.

Team size: 20 people

Technology: Node.js, AdonisJS, React, React Native, PHP, .NET 7+, WinUI 3, Socket.IO, Mux Live Streaming, Video Calling, IoT, Stripe, LINE Pay, Alipay, and other payment gateways.

Responsibilities: Spec creation, coding, testing

Project: E-commerce System

Description: A multi-vendor e-commerce platform specializing in construction materials, enabling customers to purchase products from multiple suppliers through a centralized marketplace.

The platform allows suppliers to onboard, manage product catalogs, inventory, pricing, and orders, while customers can search, compare, and purchase products through web and mobile applications. Advanced search capabilities, including vector search, are integrated to improve product discovery and recommendation accuracy.

The system supports online payments through multiple payment gateways and integrates with third-party logistics providers for delivery management. Customers can track shipments and delivery status in real time through integrated transportation services such as Uber and Capital Transport.

Administrative features include supplier management, product moderation, order tracking, payment monitoring, and marketplace operation management.

Team size: 10 people

Technology: NodeJS, NestJS, Reat, NextJS, React Native, Appollo server 4, Mongo, AWS Services, ECS, ECR, Cloudfare

Responsibilities: Spec creation, coding, testing

Project: Real estate Management System

Description: A comprehensive real estate management system designed to manage the full lifecycle of property assets, including residential and commercial real estate.

The system supports management of properties, construction companies, design companies, supervisory units, and investors involved in real estate projects. It covers end-to-end processes such as property listing, buying, selling, and leasing.

The platform also provides administrative capabilities for monitoring and tracking real estate status, including construction progress, sales activities, leasing status, and overall asset management, enabling efficient control and visibility across all projects.

Team size: 10 people

Technology: .net standard, .netFramework, VB.net, AnguarJS

Responsibilities: Project manager, system design, coding, testing

Project: Logistic Platform

Description: A logistics and freight forwarding platform designed as a marketplace for transportation services, similar to ride-hailing applications such as Grab, but focused on cargo and freight delivery. The system allows truck drivers to register as transport providers, while companies and warehouse operators can search, book, and manage transportation services based on their logistics needs.

It supports end-to-end freight management including contract creation, shipment tracking, and route monitoring. The platform enables real-time visibility of delivery status, improving coordination between shippers and transport providers.

Additionally, the system can be integrated into truck-based devices provided by vehicle suppliers, allowing seamless usage within supported logistics hardware ecosystems.

Team size: 20 people

Technology: NodeJS, Angular 5+, AWS, Firebase

Responsibilities: Spec creation, coding, testing

Project: Job Management System

Description: A centralized CV management and job recommendation system designed to store, organize, and analyze employee profiles for recruitment and partner matching purposes.

The system allows users to create and manage detailed CVs, including personal information, skills, work experience, and domain expertise. Profiles are categorized and structured to support efficient search and filtering based on multiple criteria such as industry, technical skills, and experience level.

Based on profile data, the platform provides job recommendation capabilities by matching candidate profiles with job requirements from partner companies, helping improve recruitment efficiency and candidate-job alignment.

Team size: 10 people

Technology: .NET 5, Angular 10

Responsibilities: Team leader, coding, testing

Project: Centralized Medicine Distribution System

Description: A centralized pharmaceutical distribution management system designed for managing medicine inventory at the company level and distributing drugs to multiple branches, hospitals, or partner facilities.

The system supports end-to-end pharmaceutical supply chain operations, including centralized stock management, batch tracking, expiration date monitoring, and distribution planning. Medicines are managed at the headquarters and allocated to different receiving points based on demand and supply plans.

It also handles transfer orders, delivery tracking, and inventory reconciliation between central warehouses and distribution locations, ensuring accuracy, traceability, and efficient pharmaceutical logistics.

For administrators, the platform provides monitoring and reporting features such as stock levels, distribution history, and supply chain performance analytics.

Team size: 10 people

Technology: Java, ReactJS, Django

Responsibilities: Team leader, coding, testing, maintaining

Huong Viet | 2018 - 2019

Project: Cloud Elarning Platform

Description: A cloud-based e-learning platform designed to support online education and training management. The system provides core learning management features including course management, class management, examination management, student enrollment, learning progress tracking, and assessment.

In addition to standard LMS functionalities, the platform includes a shared marketplace (CLS Share) that allows instructors and organizations to publish, buy, and sell courses through a unified ecosystem. Course providers can manage and monetize their educational content, while learners can discover, purchase, and access courses from multiple vendors.

The platform supports centralized content management, online learning, examination workflows, course transactions, and marketplace operations within a single cloud-based solution.

Team size: 20 people

Technology: .NET 2.1, Eureka, Consul, Angular 5, ELK Stack, Kubernetes, Microservices

Responsibilities: Technical design, system design, coding, testing, deployment

Japan Computer Software | 2018 - 2019

Project: Car Check System

Description: A vehicle inspection management system designed to support automotive testing and compliance verification processes. The platform integrates with specialized inspection equipment to collect and analyze vehicle performance data, including emissions, tire conditions, speed, braking performance, and other safety-related indicators.

The system automatically receives measurement results from connected devices, monitors inspection parameters in real time, and generates alerts when values exceed predefined thresholds or regulatory standards. Inspection results are recorded and managed centrally, enabling efficient tracking, reporting, and compliance management.

Administrative features include inspection workflow management, test result monitoring, equipment integration management, and inspection history tracking.

Team size: 10 people

Technology: .NET Framework, TCP Socket, ASP.NET MVC

Responsibilities: Coding, testing, document design

Project: Production process management application

Description: A production process management system designed for rubber manufacturing plants, covering the entire production lifecycle from raw material warehousing, formula-based material sourcing, production execution, quality inspection, and storage of semi-finished and finished goods.

The system supports production formula management, material consumption tracking, inventory control, and chemical loss monitoring throughout the manufacturing process. Quality control checkpoints are integrated into production workflows to ensure compliance with manufacturing standards and product specifications.

The platform also integrates with industrial devices to provide real-time operational alerts. Warning indicators and signal lights are automatically triggered when abnormal events occur, such as incorrect material selection, invalid warehouse transactions, or deviations from production procedures, helping reduce errors and improve production accuracy.

Team size: 10 people

Technology: .NET Framework, COM Port device, Win Form

Responsibilities: Coding, testing, document design, guideline design and install the system at the client's factory

Project: Internal management application for the company

Description: An internal enterprise management system designed to streamline business operations and workforce management. The platform integrates HRM and CRM functionalities, providing centralized management of employee information, attendance, leave requests, asset tracking, business performance, and operational reporting.

The system supports production planning, resource allocation, budgeting, and expense management, enabling organizations to monitor and optimize daily operations. It also provides workflow automation and reporting tools to improve visibility, decision-making, and overall business efficiency.

Administrative users can manage employees, company assets, production schedules, budgets, and performance metrics through a unified management platform.

Team size: 6 people

Technology: C#, MVVM Pattern, Sql Server, WPF, WCF

Responsibilities: Coding, testing, document design, guideline design and install the system at the client's factory

Project: Internal Tool

Description: A factory production management system developed using VBA and Microsoft Excel to streamline production planning and operational processes. The system enhances data processing efficiency by automating manual Excel operations and reducing repetitive tasks.

The platform provides functionalities for production planning, workforce management, data search, and operational reporting. Custom forms and automated workflows enable users to quickly access, update, and analyze production data, improving planning accuracy and daily operational efficiency.

The system serves as an internal management tool to support factory operations while leveraging existing Excel-based business processes.

Team size: 4 people

Technology: VBA, Excel

Responsibilities: Coding, testing, document design, guideline design
